MMI-750T-HB

Sunlight-Viewable PLC Operator Interface

Makes your information as clear as day!

Designed for outdoor viewing, the MMI-750T-HB operator interface incorporates a high contrast LCD with resistive type touch panel. The touch panel replaces hard-wired push buttons and offers improved reliability and user comfort. The operator can start, stop, toggle, or jog relays in the PLC with the touch of a designated screen area. Process parameters can also be changed easily via the touchscreen.

The MMI-750T-HB uses each PLC's communication protocol to read or write data. It does not require the PLC to run any special program for data communication. The MMI-750T-HB allows the user to optimize communications by selecting the data block size that is uploaded with each communication to the PLC. Other product features include an optional 10BaseT Ethernet (Modbus TCP/IP) connection, and a compact flash memory option (only available on units with Ethernet option).
